João G. Silva (FCUL)

Fixed point theory and periodic solutions of d

#### Brouwer Fixed Point Theorem

Let B be a closed ball in  $\mathbb{R}^n$  and  $f: B \to B$  a continuous mapping. Then there exists

 $x^* \in B$  such that  $f(x^*) = x^*$ .

#### Brouwer Fixed Point Theorem

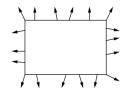

Let B be a closed ball in  $\mathbb{R}^n$  and  $f: B \to B$  a continuous mapping. Then there exists  $x^* \in B$  such that  $f(x^*) = x^*$ .

#### Poincaré-Miranda Theorem

Let  $L \in \mathbb{R}^n$ ,  $L_i \ge 0$ ,  $\Omega = \{x \in \mathbb{R}^n : |x_i| \le L_i, i = 1, ..., n\}$  and  $f : \Omega \to \mathbb{R}^n$  a continuous vector field such that

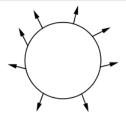

$$f_i(x_1, \dots, x_{i-1}, -L_i, x_{i+1}, \dots, x_n) \ge 0$$
, for all  $1 \le i \le n$   
 $f_i(x_1, \dots, x_{i-1}, L_i, x_{i+1}, \dots, x_n) \le 0$ , for all  $1 \le i \le n$ 

Then there is a point  $x^* \in \Omega$  such that  $f(x^*) = 0$ .

#### Theorem 1

Let  $\mathbb{B}^n = \{x \in \mathbb{R}^n : ||x|| \le 1\}$ . If  $f : \mathbb{B}^n \to \mathbb{R}^n$  is a continuous vector field such that  $\forall x \in \partial \mathbb{B}^n, f(x) \cdot x > 0$ , then the equation f(x) = 0 has a solution in  $\mathbb{B}^n$ .

Periodic solution of

$$u''(t) + \lambda u(t) + F(u(t))' = e(t)$$

F is class  $C^1$  and bounded in  $\mathbb{R}$  and F' is bounded in  $\mathbb{R}$ .

e is a  $2\pi$ -periodic continuous function.

 $\lambda$  a real parameter.

Considering the homogeneous linear part  $u'' + \lambda u = 0$  it is particularly interesting to consider the case where  $\lambda$  is an eigenvalue, i.e., there are non-trivial  $2\pi$ -periodic solutions.

# Introduction and Auxiliary Results

$$\begin{cases} u''(t) + F(u(t))' = e(t) \\ u(0) = u(2\pi), u'(0) = u'(2\pi) \end{cases}$$

1

$$\begin{cases} u''(t) + F(u(t))' = e(t) \\ u(0) = u(2\pi), u'(0) = u'(2\pi) \end{cases}$$

By integrating in  $[0, 2\pi]$  we see that a necessary condition for this problem to be solvable is  $\int_{0}^{2\pi} e(t)dt = 0$ . We now show it is also sufficient.

$$\begin{cases} u''(t) + F(u(t))' = e(t) \\ u(0) = u(2\pi), u'(0) = u'(2\pi) \end{cases}$$

By integrating in  $[0, 2\pi]$  we see that a necessary condition for this problem to be solvable is  $\int_{0}^{2\pi} e(t)dt = 0$ . We now show it is also sufficient.

By integration we get

$$\begin{cases} u'(t) + F(u(t)) = E(t) + C\\ u(0) = u(2\pi), u'(0) = u'(2\pi) \end{cases}$$

Where C is a constant and E is a fixed antiderivative.

Note that E is  $2\pi$ -periodic because  $\int_0^{2\pi} e(t) dt = 0$ .

# Introduction and auxiliary results

Consider the "initial value version" correspondent to the previous problem.

$$\begin{cases} u'(t) + F(u(t)) = E(t) + C\\ u(0) = x \end{cases}$$
(1)

ヘロト ヘロト ヘヨト

### Introduction and auxiliary results

Consider the "initial value version" correspondent to the previous problem.

$$\begin{cases} u'(t) + F(u(t)) = E(t) + C\\ u(0) = x \end{cases}$$
(1)

The solution of this problem will depend on  $\times$  and C, therefore we have a solution

u(t, x, C). By the integral formula of solutions we have that u is a solution of (1) if and only if

$$u(t, x, C) = x + \int_0^t (E(s) + C - F(u(s, x, C))) ds$$

## Introduction and auxiliary results

Consider the "initial value version" correspondent to the previous problem.

$$\begin{cases} u'(t) + F(u(t)) = E(t) + C\\ u(0) = x \end{cases}$$
(1)

The solution of this problem will depend on x and C, therefore we have a solution

u(t, x, C). By the integral formula of solutions we have that u is a solution of (1) if and only if

$$u(t, x, C) = x + \int_0^t (E(s) + C - F(u(s, x, C))) ds$$

#### Theorem

Let J = [a, b],  $K \subset \mathbb{R}$  compact and  $f : J \times \mathbb{R} \times K \to \mathbb{R}$  continuous and Lipchitz in the second variable variable. Let  $\sigma = (\alpha, \beta, \mu)$ . Then the integral equation

$$u(x,\sigma) = \beta + \int_{\alpha}^{x} f(t,u(t,\sigma),\mu) dt$$

has a unique solution  $\forall \alpha \in J, \beta \in \mathbb{R}, \mu \in K$  and the solution  $u(x, \sigma)$ , is continuous in  $J \times J \times \mathbb{R} \times K$ .

Because we want a  $2\pi$ -periodic solution

$$u(0) = u(2\pi) \Longleftrightarrow 2\pi C + \int_0^{2\pi} E(s) - F(u(s, x, C)) ds = 0$$

F and E are bounded functions (E is class  $C^1$  in  $[0, 2\pi]$ ) we can conclude that in order for u to be a periodic function, C has lower and upper bound, a and b, respectively.

Image: Image:

Because we want a  $2\pi$ -periodic solution

$$u(0) = u(2\pi) \Longleftrightarrow 2\pi C + \int_0^{2\pi} E(s) - F(u(s,x,C)) ds = 0$$

F and E are bounded functions (E is class  $C^1$  in  $[0, 2\pi]$ ) we can conclude that in order for u to be a periodic function, C has lower and upper bound, a and b, respectively.

Let 
$$h: [a,b] \rightarrow \mathbb{R}$$
,  $h(C) = 2\pi C + \int_0^{2\pi} E(s) - F(u(s,x,C)) ds$ .

By considering a large enough b and a small enough a we have h(a) < 0 and h(b) > 0and by applying Bolzano's theorem there is a  $C' \in ]a, b[$  such that h(C') = 0, that is u(t, x, C') is  $2\pi$ -periodic.

$$u''(t) + u(t) + F(u(t))' = e(t)$$

$$u''(t) + u(t) + F(u(t))' = e(t)$$

#### Theorem

Let e(t) be a  $2\pi$ -periodic function,  $F(\infty)$  and  $F(-\infty)$  exist and be finite. By setting

$$e_c = \int_0^{2\pi} \cos(x) e(x) dx$$
, and  $e_s = \int_0^{2\pi} \sin(x) e(x) dx$ 

#### Then

- The condition  $2(F(\infty) F(-\infty)) > \sqrt{e_s^2 + e_c^2}$  is sufficient to the existence of a  $2\pi$ -periodic solution of the differential equation u''(t) + u(t) + F(u(t))' = e(t).
- If ∀x ∈ ℝ, m ≤ F(x) ≤ M, for some m, M ∈ ℝ with m ≤ M, then the condition 2(M − m) ≥ √e<sub>s</sub><sup>2</sup> + e<sub>c</sub><sup>2</sup> is necessary to the existence of a 2π-periodic solution of the differential equation u''(t) + u(t) + F(u(t))' = e(t).

<ロト <問ト < 臣ト < 臣

We want to prove the existence of a solution to the problem

$$\begin{cases} u''(t) + u(t) + F(u(t))' = e(t) \\ u(0) = u(2\pi), u'(0) = u'(2\pi) \end{cases}$$
(2)

・ロン ・日 ・ ・ ヨン・

We want to prove the existence of a solution to the problem

$$\begin{cases} u''(t) + u(t) + F(u(t))' = e(t) \\ u(0) = u(2\pi), u'(0) = u'(2\pi) \end{cases}$$
(2)

Let u be a class  $C^2$  function. Consider the decomposition

$$u(x) = A\cos(x) + B\sin(x) + W(x, A, B)$$

where A = u(0) and u'(0) = B.

We want to prove the existence of a solution to the problem

$$\begin{cases} u''(t) + u(t) + F(u(t))' = e(t) \\ u(0) = u(2\pi), u'(0) = u'(2\pi) \end{cases}$$
(2)

Let u be a class  $C^2$  function. Consider the decomposition

$$u(x) = A\cos(x) + B\sin(x) + W(x, A, B)$$

where A = u(0) and u'(0) = B.

Therefore W(0, A, B) = W'(0, A, B) = 0.

$$\begin{cases} W''(t,A,B) + W(t,A,B) + F(A\cos(t) + B\sin(t) + W(t,A,B))' = e(t) \\ W(0,A,B) = W(2\pi,A,B) = 0, W'(0,A,B) = W'(2\pi,A,B) = 0 \end{cases}$$
(3)

We want to prove the existence of a solution to the problem

$$\begin{cases} u''(t) + u(t) + F(u(t))' = e(t) \\ u(0) = u(2\pi), u'(0) = u'(2\pi) \end{cases}$$
(2)

Let u be a class  $C^2$  function. Consider the decomposition

$$u(x) = A\cos(x) + B\sin(x) + W(x, A, B)$$

where A = u(0) and u'(0) = B.

Therefore W(0, A, B) = W'(0, A, B) = 0.

$$\begin{cases} W''(t,A,B) + W(t,A,B) + F(A\cos(t) + B\sin(t) + W(t,A,B))' = e(t) \\ W(0,A,B) = W(2\pi,A,B) = 0, W'(0,A,B) = W'(2\pi,A,B) = 0 \end{cases}$$
(3)

$$W(t, A, B) = \int_0^t \sin(t - x)(e(x) - F(A\cos(x) + B\sin(x) + W(x, A, B))')dx$$

・ロト ・回ト ・ヨト

João G. Silva (FCUL)

$$W'(t, A, B) = \int_0^t \cos(t - x)(e(x) - F(A\cos(x) + B\sin(x) + W(x, A, B))')dx$$

э

・ロン ・日 ・ ・ ヨン・

$$W'(t, A, B) = \int_0^t \cos(t - x)(e(x) - F(A\cos(x) + B\sin(x) + W(x, A, B))')dx$$

$$\left\{egin{array}{ll} \mathsf{W}(2\pi,A,B)=0 \ \mathsf{W}'(2\pi,A,B)=0 \end{array}
ight. \Leftrightarrow$$

э

・ロン ・回 と ・ ヨ と ・

$$W'(t, A, B) = \int_0^t \cos(t - x)(e(x) - F(A\cos(x) + B\sin(x) + W(x, A, B))')dx$$

$$\left\{egin{array}{l} \mathsf{W}(2\pi,A,B)=0 \ \mathsf{W}'(2\pi,A,B)=0 \end{array}
ight. \Leftrightarrow$$

Using integration by parts we get the system

$$\begin{cases} e_s + \int_0^{2\pi} \cos(x) F(A\cos(x) + B\sin(x) + W(x, A, B)) dx = 0\\ e_c - \int_0^{2\pi} \sin(x) F(A\cos(x) + B\sin(x) + W(x, A, B)) dx = 0\\ (B_c - B_c) F(A\cos(x) + B\sin(x) + B\sin(x) + B\sin(x)) dx = 0 \end{cases}$$

We define the vector field (X(A, B), Y(A, B)):

$$\begin{cases} X(A,B) = e_c - \int_{0}^{2\pi} \sin(x) F(A\cos(x) + B\sin(x) + W(x,A,B)) dx \\ Y(A,B) = e_s + \int_{0}^{2\pi} \cos(x) F(A\cos(x) + B\sin(x) + W(x,A,B)) dx \end{cases}$$

・ロン ・日マン ・ヨン・

We define the vector field (X(A, B), Y(A, B)):

$$\begin{cases} X(A,B) = e_c - \int_0^{2\pi} \sin(x) F(A\cos(x) + B\sin(x) + W(x,A,B)) dx \\ Y(A,B) = e_s + \int_0^{2\pi} \cos(x) F(A\cos(x) + B\sin(x) + W(x,A,B)) dx \end{cases}$$

Let  $(A,B)\in\mathbb{R}^2$ ,  $R=\sqrt{A^2+B^2}$  and  $\phi\in\mathbb{R}$ , such that

$$\cos(\phi) = \frac{B}{\sqrt{A^2 + B^2}}, \ \sin(\phi) = \frac{A}{\sqrt{A^2 + B^2}}.$$

・ロン ・日マン ・ヨン・

Consider the dot product:

 $(-Y(A,B),X(A,B))\cdot (A,B) =$ 

-

・ロト ・回ト ・ヨト・

Consider the dot product:

$$(-Y(A, B), X(A, B)) \cdot (A, B) =$$
  
= -Ae<sub>s</sub> -  $\int_{0}^{2\pi} A\cos(x)F(A\cos(x) + B\sin(x) + W(x, A, B)) dx + Be_c -$   
 $\int_{0}^{2\pi} B\sin(x)F(A\cos(x) + B\sin(x) + W(x, A, B)) dx =$   
= Be<sub>c</sub> - Ae<sub>s</sub> -  $\int_{0}^{2\pi} (A\cos(x) + B\sin(x))F(A\cos(x) + B\sin(x) + W(x, A, B)) dx =$ 

Consider the dot product:

$$(-Y(A, B), X(A, B)) \cdot (A, B) =$$

$$= -Ae_{s} - \int_{0}^{2\pi} A\cos(x)F(A\cos(x) + B\sin(x) + W(x, A, B)) dx + Be_{c} - \int_{0}^{2\pi} B\sin(x)F(A\cos(x) + B\sin(x) + W(x, A, B)) dx =$$

$$= Be_{c} - Ae_{s} - \int_{0}^{2\pi} (A\cos(x) + B\sin(x))F(A\cos(x) + B\sin(x) + W(x, A, B)) dx =$$

$$= Be_{c} - Ae_{s} - \int_{0}^{2\pi} R\sin(x + \phi)F(R\sin(x + \phi) + W(x, A, B)) dx$$

Consider the dot product:

$$(-Y(A, B), X(A, B)) \cdot (A, B) =$$

$$= -Ae_{s} - \int_{0}^{2\pi} A\cos(x)F(A\cos(x) + B\sin(x) + W(x, A, B)) dx + Be_{c} - \int_{0}^{2\pi} B\sin(x)F(A\cos(x) + B\sin(x) + W(x, A, B)) dx =$$

$$= Be_{c} - Ae_{s} - \int_{0}^{2\pi} (A\cos(x) + B\sin(x))F(A\cos(x) + B\sin(x) + W(x, A, B)) dx =$$

$$= Be_{c} - Ae_{s} - \int_{0}^{2\pi} R\sin(x + \phi)F(R\sin(x + \phi) + W(x, A, B)) dx$$

$$\leq ||(A, B)|| \times ||(e_{s}, e_{c})|| - \int_{0}^{2\pi} R\sin(x + \phi)F(R\sin(x + \phi) + W(x, A, B)) dx =$$

$$= R \times \sqrt{e_{c}^{2} + e_{s}^{2}} - \int_{0}^{2\pi} R\sin(x + \phi)F(R\sin(x + \phi) + W(x, A, B)) dx =$$

$$= R \left( \sqrt{e_{c}^{2} + e_{s}^{2}} - \int_{0}^{2\pi} \sin(x + \phi)F(R\sin(x + \phi) + W(x, A, B)) dx \right)$$

With the assumptions on F we have that

$$\frac{\sqrt{e_c^2 + e_s^2} - \int_0^{2\pi} \sin(x + \phi) F(R \sin(x + \phi) + W(x, A, B)) dx}{\sqrt{e_c^2 + e_s^2} - 2(F(\infty) - F(-\infty)) < 0}$$

as  $R \to \infty$  uniformly with respect to  $\phi \in \mathbb{R}$ . Note that W is a bounded function in  $[0, 2\pi]$  independently of A,B.

メロト メロト メヨト メ

With the assumptions on F we have that

$$\frac{\sqrt{e_c^2 + e_s^2} - \int_0^{2\pi} \sin(x + \phi) F(R\sin(x + \phi) + W(x, A, B)) dx}{\sqrt{e_c^2 + e_s^2} - 2(F(\infty) - F(-\infty)) < 0}$$

as  $R \to \infty$  uniformly with respect to  $\phi \in \mathbb{R}$ . Note that W is a bounded function in  $[0, 2\pi]$  independently of A,B.

Therefore there is  $R_0 \in \mathbb{R}$  such that,

$$\forall (A,B) \in \mathbb{R}^2 : \|(A,B)\| \geq R_0 \implies (-Y(A,B),X(A,B)) \cdot (A,B) < 0$$

and in particular,

$$\forall (A,B) \in \mathbb{R}^2 : \| (A,B) \| = R_0 \implies (Y(A,B),-X(A,B)) \cdot (A,B) > 0$$

With the assumptions on F we have that

$$\frac{\sqrt{e_c^2 + e_s^2} - \int_0^{2\pi} \sin(x + \phi) F(R\sin(x + \phi) + W(x, A, B)) dx}{\sqrt{e_c^2 + e_s^2} - 2(F(\infty) - F(-\infty)) < 0}$$

as  $R \to \infty$  uniformly with respect to  $\phi \in \mathbb{R}$ . Note that W is a bounded function in  $[0, 2\pi]$  independently of A,B.

Therefore there is  $R_0 \in \mathbb{R}$  such that,

$$orall (A,B)\in \mathbb{R}^2: \|(A,B)\|\geq R_0 \implies (-Y(A,B),X(A,B))\cdot (A,B)<0$$

and in particular,

$$\forall (A,B) \in \mathbb{R}^2 : \| (A,B) \| = R_0 \implies (Y(A,B),-X(A,B)) \cdot (A,B) > 0$$

By theorem 1 there is a  $(A^*,B^*)\in \mathbb{R}^2$  with  $\|(A^*,B^*)\|< R_0$  such that

$$X(A^*, B^*) = Y(A^*, B^*) = 0.$$

Hence we have a solution of (2).

# u''(t) + u(t) + F(u(t))' + g(u(t)) = e(t)
